

Big Data Analytics Lab

VIVA QUESTIONS

1. What is R and what are the main features of R?
2. What are the applications of R?
3. List any three basic data types in R
4. List any three derived data types in R?
5. What are the branching statements in R? Write the syntax of each
6. What are the looping statements in R? Write the syntax of each
7. What is a vector in R?
8. How do you create a data frame in R?
9. What are the advantages of using R?
10. What are the packages used for visualization in R?
11. How do you build linear regression in R?
12. How do you build logistic regression in R?
13. What is the difference between linear regression and logistic regression?
14. What are the packages needed to create a decision tree algorithm in R?
15. What are the statistical operations? How do you create all the functions using inbuilt functions and without using inbuilt functions?
16. What is correlation and covariance? Why are these values important in statistics?
17. Which package is used to create an SVM model in R?
18. How do you build a K-means clustering model in R?
19. What is the difference between KNN and K-Means clustering?
20. Why are statistical operations so important in data analysis?
21. What is Big data? Where does it come from? How does it work?
22. What are the applications of Big Data?
23. What is the difference between unstructured, semi-structured and structured data?
24. What are the 5 Vs in Big Data?
25. What are the key differences between on premises and cloud-based big data solutions?
26. What are the different output formats in Hadoop?
27. Mention the common input formats in Hadoop?
28. What are the three models that Hadoop can run?
29. How to deploy a Big data model? Mention the key steps?
30. What is HDFS?
31. Explain the features of Hadoop
32. Explain the core components of Hadoop
33. What are the different big data processing techniques?
34. What is Map Reduce in Hadoop?
35. When to use Map Reduce with Big Data?
